Extended-Infusion Cefepime

As emerging antibiotic resistance limits treatment options for some bacteria, dose optimization is a key component for treatment success.

Extending the infusion of cefepime is recommended to optimize dosing for some infections.

Intermittent (Traditional) Infusion: 30 min

Extended (Prolonged) Infusion: 240 min

If co-infusing other IV medications, verify compatibility with Trissel's IV Compatibility Chart via Lexicomp.

Contact team pharmacist with questions related to compatibility, IV line access, or medication scheduling.
